FIRE-RESISTANT VERSION

BXE-M

BXE-M is the fire-resistant version of the BX-E. It replaces the old BX-F version.

BXE-M has been tested by IEC 60331-1 standard, with a thermal shock temperature kept within the 830 to 870 °C.

The test was performed for a duration of three hours instead of the two hours required on cables.

BXE-M granted electrical continuity for the duration of the test (3 hours), and was certified accordingly.

With the exception of the fire-resistance feature, BXE-M has the same technical specifications, dimensions etc. as standard BX-E.

To order BXE-M, replace the first digit of the reference number with the letter "M".

Example: straight feeder element, standard length 3 meters, 3P+N+PE, aluminium bars, 1600 A rating:

- Standard BX-E code = **234600Z3LPA**
- Fire-resistant BXE-M code = **M34600Z3LPA**

IP68 RESIN-TYPE VERSION

BX-R

BX-R is the IP68 version of BX-E.

The IP68 protection degree is achieved through resin-casting of the duct during the manufacturing process, which is then completed through resin-casting of the joints during final installation.

The system is IP68 only after correct and complete installation, and only after the resin poured on site into the joints is thoroughly solidified (in this regard, refer to our website and to the specific BX-R installation manual). In the event of outdoor installation, the use of a protective canopy manufactured by Pogliano is in any case mandatory, in order to improve the duct protection and lengthen its life.

The BX-R has been tested according to UNI EN 13501-2 standard obtaining the EI 60 class certification.

BX-R technical specifications and dimensions are the same as the ones of standard BX-E, with minor variations that do not affect performance. For further details contact Pogliano BusBar s.r.l.

For the fire-resistant version of BX-R, please contact Pogliano BusBar s.r.l.

The two-component resin used for the BX-R production has the following characteristics:

- Low shrinkage during hardening
- Excellent resistance to thermal cycles and water
- Excellent electrical properties
- Excellent heat dissipation
- Suitable for application up to 180 °C according to standard ASTM D-2307
- Self-extinguishing approved UL94V0 4mm
- Included in UL insulating system for 155°C: E317429, DV-155J tables IX and XI
- EN 45545-2 approved: HL2 for R22 and HL3 for R23

To order the BX-R version, change as follows the product codes shown on the next pages:

- First product code digit: 2 → 4
- Last 3 product code digits: LPA → R0A

Example of straight feeder section, 3 meters long, 3P+N+PE, aluminium, rating 1600 A:

- Standard BX-E code = **234600Z3LPA**
- BX-R code = **434600Z3R0A**

BX-E

GENERAL FEATURES

BX-E system meets customers' needs through a wide range of special shapes and sizes to allow maximum design flexibility, layout adaptability and ease of installation.

The subdivision of the runs into modular elements facilitates maintenance and future modifications, and it ensures safety by easing the installation of protective devices.

The sandwich-type design reduces overall dimensions and enhances resistance to mechanical stresses.

Straight elements come in 3-meter standard lengths, but all busbar trunking sections can be made to measure with a minimum length starting from 410 mm.

BX-E system is suitable for frequencies of 50 or 60 Hz and voltages up to 1000 V, with rated currents from 800 A to 6300 A.

The dielectric test, i.e. the insulation test, is performed at 3500 Vcc.

The product can be installed flatwise, edgewise or vertically as a rising main without any current derating. In case of edgewise installation the neutral conductor must be at the bottom.

The neutral conductor is indicated on both sides of the duct and can also be identified by the position of the screws on the joint covers: the neutral conductor position corresponds to the screw closest to the joint.

Bars are made of aluminium alloy, tin-plated and galvanically treated, or of 99.9% pure electrolytic copper, with a cross section that minimizes electrical resistance.

Ducts can be single, double or triple depending on rated current,

but always with a single housing to reduce overall dimensions and facilitate handling and installation. Electrical parallel is guaranteed at each joint, ensuring balanced currents.

Each bar is insulated by two layers of F-class polyester films, suitable for operating up to 155 °C. The busbars are then packed together (sandwich design).

BX-E is a low-impedance system. This makes for low voltage drops and reduced Joule losses and, consequently, efficient performance and lower operating costs (energy saving).

Joints are designed with a single-bolt clamping structure equipped, depending on rating, with 1, 2, 4 or 6 double-headed break-off bolts. Break-off occurs at the prescribed torque of 60 Nm. Random checking of tightening by means of a torque wrench is nevertheless advisable. This, carried out by experienced staff and with the appropriate safety equipment, can be done without turning off the power.

The joint stacks are also equipped with Belleville washers, which ensures even distribution of tightening torque and compensation of thermal expansion.

Finally, performance is optimized by silver-plated copper plates, standard feature of BX-E joints.

Thus, with a single operation, the following is ensured:

- Electrical and mechanical junction of same-phase busbars, including PE conductor.
- Electrical insulation between different-phase busbars, by use of insulating spacers.
- Electrical parallel between same-phase busbars in multiple-duct systems.
- Compensation of linear thermal expansion.

BX-E

GENERAL FEATURES

BX-E is classified as follows:

- Overvoltage class III or IV, depending on the nominal voltage of the system and on the position of the line.
- Pollution degree 3.

The standard of the housing is steel or aluminium sheets, thickness 1.5 mm, painted RAL 7032.

The steel housing version reduces electromagnetic emissions and ensures high mechanical strength, while the aluminium housing version reduces weight and increases the cross-section of the earth/PE conductor.

The housing may be painted RAL 7035 on request. For other RALs, consult our sales department.

The housing is the PE conductor. Additional PE conductors can be provided on request.

The maximum allowed ambient temperature is 40 °C, with an average of a maximum 35 °C over a period of 24 hours.

The minimum allowed ambient temperature is -5 °C for indoor installations and -25 °C for outdoor installations, in accordance with EN 61439 standard.

Heat is dissipated through the housing surface which, at the rated current and regardless of horizontal or vertical installation, has a maximum temperature rise of 55 °C with respect to ambient temperature.

BX-E and BXE-M standard protection degree is IP55. IP65 can be provided on request, with a price supplement.

The BX-R version has IP68 protection degree.

The standard reference for the IP protection degree is EN/IEC 60529.

The protection degree always and exclusively refers to the product completely and correctly installed.

In case of outdoor installation, it is mandatory to protect the duct by means of a specific canopy manufactured by Pogliano Busbar Srl (valid for the BX-R version as well).

Brackets clamping is easy and quick, and it ensures high resistance to mechanical loads.

Straight plug-in elements are interchangeable with straight feeder elements, which allows for modifications.

Tap-off outlets can be on one or both duct sides, always on the fixed-dimension side (137 mm). In case of single-side outlets, the maximum is 3 outlets. In case of double-side outlets the maximum, depending on current rating, is 2 or 3 outlets per side, which means a maximum of 4 or 6 outlets per 3-meter element.

Tap-off units, also called plugs, are available equipped with or preset for MCCB, or with isolator and fuse holders. All tap-off units are polarized to ensure correct positioning during installation.

The tap-off units mounted on the outlets and with ratings up to 630 A can be installed even without turning off the power, with the appropriate safety equipment and precautions. For ratings of 800 A and above, the power must be turned off.

It is also possible to mount tap-off units directly on the joints, with the power turned off. The tap-off units mounted on the joints require a special joint, to be purchased separately.

The product complies with national and international standards: CEI EN and IEC 61439-1 and 61439-6.

SUSTAINABILITY

BX-E is a halogen-free system with high recyclability potential*.

Furthermore, a line of BX-E allows energy savings thanks to its low Joule losses.

Therefore, BX-E may be defined as a green product, which reflects the modern standards of sustainability.

* Taking as an example a 3-meter straight feeder element, 800 A rating, aluminium bars and steel housing: approximately 97% of its materials fall into the categories of recyclable materials.

BX-E

GENERAL FEATURES

BUSBAR TRUNKING SECTIONS SIZES

The standard ducts are:

- Single ducts, for ratings up to 2000 A aluminium and 2500 A copper (included).
- Double ducts, for ratings up to 4000 A aluminium and 5000 A copper (included).
- Triple ducts, for the 5000 A aluminium rating.

Special executions are available upon request.

The electrical parallel of multiple-duct trunking systems is always guaranteed by the joint.

One cross section side of the ducts has a fixed size of 137 mm, while the other side has the following dimensions:

ALUMINIUM				COPPER		
Rating	Ducts	H	H for ATR terminal element	Ducts	H	H for ATR terminal element
800 A	1	85 mm	85 mm			
1000 A	1	95 mm	95 mm	1	85 mm	85 mm
1250 A	1	121 mm	121 mm	1	85 mm	85 mm
1600 A	1	160 mm	160 mm	1	121 mm	121 mm
2000 A	1	205 mm	205 mm	1	150 mm	150 mm
2500 A	2	286 mm	270 mm	1	185 mm	185 mm
3200 A	2	376 mm	360 mm	2	248 mm	232 mm
4000 A	2	416 mm	400 mm	2	306 mm	290 mm
5000 A	3	567 mm	535 mm	2	376 mm	360 mm
6300 A		not available				on request

CAUTION

Some sections exceed the above indicated H dimensions. Examples:

- Joints.
- Outlets on straight plug-in elements: each outlet exceeds the H dimension by 28 mm.
- Some sections (i.e. transposition element, edgewise T, expansion joint, etc.) contain, in the central part, electrical connections that increase the overall dimensions.

BX-R

CAUTION

The BX-R version has an H dimension increased by 5 mm.
For more details please contact Pogliano Busbar S.r.l.

MEASUREMENT OF NON-STANDARD ELEMENTS

Special elements with length in the range of 410 - 3000 mm can be manufactured.

The length of a special element must be measured as shown in the image alongside.

Finally, it is necessary to subtract 220 mm from the measured X dimension to obtain the length of the special element.

Example:

- Measured dimension (X) 2423 mm.
- Length of special element $2423 - 220 = 2203$ mm.

ALIGNMENT

The mounting system allows to adjust the position before you tighten the screws (12Nm).

TERMINAL CONNECTIONS

JOINT INSTALLATION

1

Before installation make sure the joint is clean and that it hasn't been damaged during transportation. Draw the element nearer, paying attention to the insertion of the bars into the joint stack.

4

Proceed with the installation of the side flanges

2

Draw the two elements nearer until you reach the 220 mm position. Check that all conductors are in the right position and aligned.

5

Proceed with the assembly of the upper and lower flanges. Tighten all flange screws. The degree of protection of the duct (IP55/65) is guaranteed only after installation and with fully assembled product.

3

Torque until the double-head bolt breaks off (at 60 Nm).

Random checking of tightening by means of a torque wrench is nevertheless advisable.

The check of the tightening torque, carried out by experienced staff and with the appropriate safety equipment, can be done without turning off the power.

CAUTION: if joints are not torqued at 60 Nm, over time the busbar may overheat and have a short circuit.

BX-R: before pouring the resin, carry out an insulation test on the joints

6

Fill the hole with the joint cap. Joint installation is complete.

Before powering, measure the insulation resistance (minimum values are given by the EN 61439 standard).

BX-R

GENERAL FEATURES

BX-R JOINT INSTALLATION

In addition to the steps indicated on the previous page, the BX-R joint installation requires some additional steps illustrated below.

NB: for detailed BX-R installation instructions please refer to our website and to the specific installation manual.

FLATWISE INSTALLATION

7

Fill the joint with the resin previously prepared as per our instructions, pouring it into the dedicated slot according to the type of installation.

EDGEWISE INSTALLATION RISING COLUMN

CAUTION

Wait the resin to deposit and fill again the joint.
Repeat the procedure until the resin level inside the joint stabilizes.
The process correctly ends when the conductor bars are fully and stably covered by the resin.

8

When the filling procedure is complete, close the slot with the dedicated plate. Now the assembly is complete.

**NB: the shown installation is a schematic representation.
For correct installation, please refer to our website
and to the specific installation manual.**

* For more versions please contact Pogliano Busbar S.r.l.

Fire barrier to prevent the chimney effect and the spreading of flames when crossing walls or slabs, to be purchased separately as an additional accessory for straight elements.

Certified only as 700 mm length. EI180 class according to UNI EN 13501-2:2016.

The barrier is made of calcium silicate panels with a hydrated mineral matrix.

The empty spaces between panels and conductive elements are filled with rockwool.

The gaps between panels and housing are filled with a special sealing paste.

To protect the barrier during transport and handling, a protective metal box is applied around the fire barrier. The protection must be removed on site before installation.

Installation requires a hole in the wall/slab larger in size than the barrier.

At the end of the installation, close the empty spaces surrounding the barrier with REI materials with equal or higher class than REI180.

Fire barriers are not protected from dust and liquids.

COMBINED ELBOWS FLATWISE+EDGEWISE and EDGEWISE+FLATWISE

CAUTION

For technical data see pages 50-53

For cross-section dimensions see page 8

Note: dimensions referred to the joint are on its center line

The tables shown in this page have the flatwise elbow first, then the edgewise elbow.

To obtain the reverse sequence (edgewise then flatwise) order the element as per beside tables and, during installation, move the joint to the opposite element end.

The dimensions A and B always refer to the joint center, therefore the position of the joint itself has no effect on the element product code.

The transposition element is useful for connecting two line sections that require different conductors arrangement.
The input and output conductors arrangement is made according to specific customer's request (phase reversal only, all conductors reversed, etc.).

The expansion joint is used to compensate line expansions and movements, both linear and angular, greater than the typical ones (e.g. to match buildings expansion joints). It is made up of 2 TT terminal elements with flexible electrical and mechanical connections.

In-line mounted feed-in box for the intermediate power supply of the line, equipped with connection plates with cable lugs.

The two line branches are powered simultaneously in order to reduce voltage drops.

It is not possible to use intermediate feed-in boxes to supply the two branches independently.

CAUTION

Regardless of rating, the total current of the two branches MUST NOT exceed the nominal In rating of the feed-in box.

NOTE : to address specific requests for quotations or orders, please refer to the following versions *

Reference number digit position	2 nd digit	3 rd digit	9 th digit	10 th digit	11 th digit

PLUG-IN TAP-OFF UNITS

BX-R

CAUTION

For plug-in elements to be installed in BX-R lines please contact Pogliano Busbar S.r.l.

Tap-off units with ratings up to 630 A and mounted on straight plug-in elements are of the plug-in type, which means that, using appropriate safety equipment, they can be installed without turning off the power of the run.

The tap-off units mounted on straight plug-in elements are:

- Equipped with mechanical safety interlock, which prevents insertion/extraction when the MCCB is closed.
- Polarized to prevent reversed insertion.

During insertion, the PE contact connects to the PE conductor of the plug-in element before phase contacts.

All sizes of tap-off units can be used on ducts of any rating.

The following page shows the main models of tap-off units suitable for mounting on straight plug-in elements.

Models with isolator and fuse holders are supplied without fuses.

Our standard plugs are either preset for or equipped with ABB MCCBs with the functions requested by the client. We can also supply units set for other makes, if the client so wishes.

Many variants are available. Some examples:

- Last digit of the reference number "W" for versions preset for ABB MCCBs, which are then chosen by the customer.
- Last digit of the reference number "Z" for empty units.
- Version with screwed cover, in cases where the available space does not allow a hinged-opening cover.

SPECIAL JOINT

In order to ensure a correct assembly, special joints must be ordered (separately) for the following units:

- Joint-mounted intermediate feed-in box.
- Joint-mounted tap-off plugs.

The special joint must be ordered based on the line rating.

BX-R

CAUTION

For plug-in elements to be installed in BX-R lines please contact Pogliano Busbar S.r.l.

HANGERS

The duct can be installed both flatwise or edgewise (in the latter case the neutral conductor must be at the bottom), as well as in horizontal or vertical position.

The distance between hangers must be:

- 3 m for single ducts with edgewise installation.
- 2 m for single ducts with flatwise installation and, regardless of the position, for double and triple ducts.

Flatwise installation

Edgewise installation

Rising column with bolts through the housing holes

* For the flatwise hanger version this dimension is (housing H + 50 mm)

Slot 9,5x28

Holes for vertical installation (rising column), to pass bolts through the housing for support

Holes for housing rivets

** 40 mm for the reduced-size hanger version

To calculate the voltage drop of a line, multiply the above values by the ratio between actual load and rated current and by the length of the line, in meters.
For distributed loads divide the result by 2

e.g.: a 30 meters long BX-E 4000A line with an actual current of 3200A and $\cos \Phi = 0,9$
 $\Delta V = 3200/4000 \times 30 \times 0,085 \text{ V/m} = 2,05 \text{ V}$ -- with concentrated load
 $\Delta V = 2,05 \text{ V} / 2 = 1,025 \text{ V}$ -- with distributed load

POGLIANOBUSBAR

Herewith declares that the products:

BX-E, BXE-M and BX-R

Comply to the provisions of the following EU directive:

N° 2014/35/EU

Directive of European Parliament and of the Council on the harmonisation of the laws of the Member States relating to the making available on the market of electrical equipment designed for use within certain voltage limits

N° 2014/30/EU

Directive of European Parliament and of the Council on the harmonisation of the laws of the Member States relating to electromagnetic compatibility (EMC)

N° 2011/65/EU

Directive of European Parliament and of the Council on the restriction of the use of certain hazardous substances in electrical and electronic equipment (RoHS)

The harmonized standards listed below have been applied:

CEI EN 61439-1

Low-voltage switchgear and controlgear assemblies
Part 1: General rules

CEI EN 61439-6

Low-voltage switchgear and controlgear assemblies
Part 6: Busbar trunking systems (busways)

CEI EN 60529

Degree of protection provided by enclosures (IP code)
